**Recap: Computing at scale**

- Modern applications require huge amounts of processing and data
  - Measured in petabytes, millions of users, billions of objects
  - Need special hardware, algorithms, tools to work at this scale
- Clusters and data centers can provide the resources we need
  - Main difference: Scale (room-sized vs. building-sized)
  - Special hardware; power and cooling are big concerns
- Clusters and data centers are not perfect
  - Difficult to dimension; expensive; difficult to scale

WiSe Lab @ WMU

Cloud Computing 2017

29

---

---

---

---

---

---

---

---

### The power plant analogy

- It used to be that everyone had their own power source
  - Challenges are similar to the cluster: Needs large up-front investment, expertise to operate, difficult to scale up/down...

WiSe Lab @ WMU  
www.cs.wmich.edu/wise      Cloud Computing    2017      30

---

---

---

---

---

---

---

---

---

---

### Scaling the power plant

- Then people started to build large, centralized power plants with very large capacity...

WiSe Lab @ WMU  
www.cs.wmich.edu/wise      Cloud Computing    2017      31

---

---

---

---

---

---

---

---

---

---

### Metered usage model

Power source      Network      Metering device      Customer device

- Power plants are connected to customers by a network
- Usage is metered, and everyone (basically) pays only for what they actually use

WiSe Lab @ WMU

### What is cloud computing?

The interesting thing about Cloud Computing is that we've redefined Cloud Computing to include everything that we already do... I don't understand what we would do differently in the light of Cloud Computing other than change the wording of some of our ads.

Larry Ellison, quoted in the Wall Street Journal, September 26, 2008

A lot of people are jumping on the [cloud] bandwagon, but I have not heard two people say the same thing about it. There are multiple definitions out there of "the cloud".

Andy Ishenwood, quoted in ZDnet News, December 11, 2008

WiSe Lab @ WMU      Cloud Computing      2017      35

---

---

---

---

---

---

---

---

## So what is it, really?

- According to NIST:
 

Cloud computing is a model for enabling convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.
- Essential characteristics:
  - On-demand self service
  - Broad network access
  - Resource pooling
  - Rapid elasticity
  - Measured service

WiSe Lab @ WMU      Cloud Computing    2017      36  
www.cs.wmich.edu/wise

---

---

---

---

---

---

---

---

## Other terms you may have heard

- Utility computing
  - The service being sold by a cloud
  - Focuses on the business model (pay-as-you-go), similar to classical utility companies
- The Web
  - The Internet's information sharing model
  - Some web services run on clouds, but not all
- The Internet
  - A network of networks.
  - Used by the web; connects (most) clouds to their customers

WiSe Lab @ WMU      Cloud Computing    2017      37  
www.cs.wmich.edu/wise

---

---

---

---

---

---

---

---

## Plan for today

- AWS starter – EC2, VPC, SecurityGroups, Storage ✓
- Computing at scale
  - The need for scalability; scale of current services ✓
  - Scaling up: From PCs to data centers ✓
  - Problems with 'classical' scaling techniques ✓
- Utility computing and cloud computing
  - What are utility computing and cloud computing? ✓
  - What kinds of clouds exist today? ← NEXT
  - What kinds of applications run on the cloud?
  - Virtualization: How clouds work 'under the hood'
  - Some cloud computing challenges

WiSe Lab @ WMU      Cloud Computing    2017      38  
www.cs.wmich.edu/wise

---

---

---

---

---

---

---

## Everything as a Service

- What kind of service does the cloud provide?
  - Does it offer an entire application, or just resources?
  - If resources, what kind / level of abstraction?
- Three types commonly distinguished:
  - Software as a service (SaaS)
    - Analogy: Restaurant. Prepares & serves entire meal, does the dishes, ...
  - Platform as a service (PaaS)
    - Analogy: Take-out food. Prepares meal, but does not serve it.
  - Infrastructure as a service (IaaS)
    - Analogy: Grocery store. Provides raw ingredients.
  - Other xaaS types have been defined, but are less common
    - Desktop, Backend, Communication, Network, Monitoring, ...

WiSe Lab @ WMU  
www.cs.wmich.edu/wise
Cloud Computing 2017

---

---

---

---

---

---

---

---

## Software as a Service (SaaS)

The diagram shows a User on the left interacting with a Cloud provider (represented by a server rack icon). The Cloud provider is connected to a stack of three layers: Application (top), Middleware (middle), and Hardware (bottom). A dashed oval encloses the Application, Middleware, and Hardware layers. Arrows indicate bidirectional communication between the User and the Application layer, and between the Application and Middleware layers.

- Cloud provides an entire application
  - Word processor, spreadsheet, CRM software, calendar...
  - Customer pays cloud provider
  - Example: Google Apps, Salesforce.com

WiSe Lab @ WMU  
www.cs.wmich.edu/wise
Cloud Computing 2017
40

---

---

---

---

---

---

---

---

## Platform as a Service (PaaS)

The diagram shows a SaaS provider on the left interacting with a User and a Cloud provider (represented by a server rack icon). The Cloud provider is connected to a stack of three layers: Application (top), Middleware (middle), and Hardware (bottom). A dashed oval encloses the Application, Middleware, and Hardware layers. Arrows indicate bidirectional communication between the SaaS provider and the Application layer, and between the Application and Middleware layers. The User is also shown interacting with the SaaS provider.

- Cloud provides middleware/infrastructure
  - For example, Microsoft Common Language Runtime (CLR)
  - Customer pays SaaS provider for the service; SaaS provider pays the cloud for the infrastructure
  - Example: Windows Azure, Google App Engine

WiSe Lab @ WMU  
www.cs.wmich.edu/wise
Cloud Computing 2017
41

---

---

---

---

---

---

---

---

### Infrastructure as a Service (IaaS)

- Cloud provides raw computing resources
  - Virtual machine, blade server, hard disk, ...
  - Customer pays SaaS provider for the service; SaaS provider pays the cloud for the resources
  - Examples: Amazon Web Services, Rackspace Cloud, GoGrid

WiSe Lab @ WMU  
www.cs.wmich.edu/wise Cloud Computing 2017 42

---

---

---

---

---

---

---

---

---

---

### Private/hybrid/community clouds

- Who can become a customer of the cloud?
  - **Public cloud:** Commercial service; open to (almost) anyone.  
Example: Amazon AWS, Microsoft Azure, Google App Engine
  - **Community cloud:** Shared by several similar organizations.  
Example: Google's "Gov Cloud"
  - **Private cloud:** Shared within a single organization.  
Example: Internal datacenter of a large company.

**Examples of cloud applications**

- Application hosting
- Backup and Storage
- Content delivery
- E-commerce
- High-performance computing
- Media hosting
- On-demand workforce
- Search engines
- Web hosting

---

---

---

---

---

---

**Case study: animoto**

- Animoto: Lets users create videos from their own photos/music
  - Auto-edits photos and aligns them with the music, so it "looks good"
- Built using Amazon EC2+S3+SQS
- Released a Facebook app in mid-April 2008
  - More than **750,000 people** signed up within **3 days**
  - EC2 usage went from 50 machines to 3,500 (x70 scalability!)

Animoto: This Week's EC2 Instance Usage

---

---

---

**Case study: The Washington Post**

- March 19, 2008: Hillary Clinton's official White House schedule released to the public
  - 17,481 pages of non-searchable, low-quality PDF
  - Very interesting to journalists, but would have required hundreds of man-hours to evaluate
  - Peter Harkins, Senior Engineer at The Washington Post: Can we make that data available more quickly, ideally within the same news cycle?
  - Tested various Optical Character Recognition (OCR) programs; estimated required speed
  - Launched 200 EC2 instances; project was completed within nine hours (!) using 1,407 hours of VM time (\$144.62)
  - Results available on the web only 26 hours after the release

WiSe Lab @ WMU Cloud Computing 2017 47  
www.cs.wmich.edu/wise

---

---

---

---

---

---

---

---

### Other examples

- DreamWorks is using the Cerelink cloud to render animation movies
  - Cloud was already used to render parts of *Shrek Forever After* and *How to Train your Dragon*
- CERN is working on a "science cloud" to process experimental data
- Virgin Atlantic is hosting their new travel portal on Amazon AWS

Cloud Computing 2017 48

---

---

---

---

---

---

---

---

### Recap: Utility/cloud computing

- Why is cloud computing attractive?
  - Analogy to 'classical' utilities (electricity, water, ...)
  - No up-front investment (pay-as-you-go model)
  - Low price due to economies of scale
  - Elasticity - can quickly scale up/down as demand varies
- Different types of clouds
  - SaaS, PaaS, IaaS; public/private/community clouds
- What runs on the cloud?
  - Many potential applications: Application hosting, backup/storage, scientific computing, content delivery, ...
  - Not yet suitable for certain applications (sensitive data, compliance requirements)

WiSe Lab @ WMU  
www.cs.wmich.edu/wise
Cloud Computing 2017 49

---

---

---

---

---

---

---

---

### Is the cloud good for everything?

- No.
- Sometimes it is problematic, e.g., because of auditability requirements
- Example: Processing medical records
  - HIPAA (Health Insurance Portability and Accountability Act) privacy and security rule
- Example: Processing financial information
  - Sarbanes-Oxley act
- Would you put your medical data on the cloud?
  - Why / why not?

WiSe Lab @ WMU  
www.cs.wmich.edu/wise
Cloud Computing 2017 50

---

---

---

---

---

---

---

---

### Recap: Cloud applications

- Clouds are good for many things...
  - Applications that involve large amounts of computation, storage, bandwidth
  - Especially when lots of resources are needed quickly (Washington Post example) or load varies rapidly (TicketLeap example)
- ... but not for all things

WiSe Lab @ WMU      Cloud Computing    2017      51

www.cs.wmich.edu/wise

---

---

---

---

---

---

---

---

### What is virtualization?

Alice  
Physical machine

Bob  
Charlie  
Daniel

- Suppose Alice has a machine with 4 CPUs and 8 GB of memory, and three customers:
  - Bob wants a machine with 1 CPU and 3GB of memory
  - Charlie wants 2 CPUs and 1GB of memory
  - Daniel wants 1 CPU and 4GB of memory
- What should Alice do?

WiSe Lab @ WMU      Cloud Computing    2017      53  
www.cs.wmich.edu/wise

---

---

---

---

---

---

---

---

### What is virtualization?

- Alice can sell each customer a **virtual machine (VM)** with the requested resources
  - From each customer's perspective, it appears as if they had a physical machine all by themselves (**isolation**)

WiSe Lab @ WMU  
www.cs.wmich.edu/wise Cloud Computing 2017 54

---

---

---

---

---

---

---

---

---

---

### How does it work?

VM	VM Start	VM End
1	0-99	0-99
1	200-399	100-199
2	0-99	300-399
2	200-299	500-599
2	600-699	400-499

- Resources (CPU, memory, ...) are virtualized
  - VMM ("Hypervisor") has translation tables that map requests for virtual resources to physical resources
  - Example: VM 1 accesses memory cell #323; VMM maps this to memory cell 123.
  - For which resources does this (not) work?
  - How do VMMs differ from OS kernels?

WiSe Lab @ WMU  
www.cs.wmich.edu/wise Cloud Computing 2017 55

---

---

---

---

---

---

---

---

---

---

### Benefit: Migration

- What if the machine needs to be shut down?
  - e.g., for maintenance, consolidation, ...
  - Alice can **migrate** the VMs to different physical machines without any customers noticing

WiSe Lab @ WMU  
www.cs.wmich.edu/wise Cloud Computing 2017 56

---

---

---

---

---

---

---

---

---

---

### Benefit: Time sharing

- What if Alice gets another customer?
  - Multiple VMs can **time-share** the existing resources
  - Result: Alice has more virtual CPUs and virtual memory than physical resources (but not all can be active at the same time)

WiSe Lab @ WMU  
www.cs.wmich.edu/wise      Cloud Computing    2017      57

---

---

---

---

---

---

---

---

---

---

### Benefit and challenge: Isolation

- Good: Emil can't access Charlie's data
- Bad: What if the load suddenly increases?
  - Example: Emil's VM shares CPUs with Charlie's VM, and Charlie suddenly starts a large compute job
  - Emil's performance may decrease as a result
  - VMM can move Emil's software to a different CPU, or migrate it to a different machine

WiSe Lab @ WMU  
www.cs.wmich.edu/wise      Cloud Computing    2017      58

---

---

---

---

---

---

---

---

---

---

### Recap: Virtualization in the cloud

- Gives cloud provider a lot of flexibility
  - Can produce VMs with different capabilities
  - Can migrate VMs if necessary (e.g., for maintenance)
  - Can increase load by overcommitting resources
- Provides security and isolation
  - Programs in one VM cannot influence programs in another
- Convenient for users
  - Complete control over the virtual 'hardware' (can install own operating system, own applications, ...)
- But: Performance may be hard to predict
  - Load changes in other VMs on the same physical machine may affect the performance seen by the customer

WiSe Lab @ WMU

### 10 obstacles and opportunities

1. Availability
  - What happens to my business if there is an outage in the cloud?

Service	Duration	Date
S3	6-8 hrs	7/20/08
AppEngine	5 hrs	6/17/08
Gmail	1.5 hrs	8/11/08
Azure	22 hrs	3/13/09
Intuit	36 hrs	6/16/10
EBS	>3 days	4/21/11
ECC	~2 hrs	6/30/12

Some cloud outages

2. Data lock-in
  - How do I move my data from one cloud to another?
3. Data confidentiality and auditability
  - How do I make sure that the cloud doesn't leak my confidential data?
  - Can I comply with regulations like HIPAA and Sarbanes/Oxley?

WiSe Lab @ WMU      Cloud Computing      2017      61  
www.cs.wmich.edu/wise

---

---

---

---

---

---

---

---

### 10 obstacles and opportunities

4. Data transfer bottlenecks
  - How do I copy large amounts of data from/to the cloud?
  - Example: 10 TB from UC Berkeley to Amazon in Seattle, WA
  - Motivated Import/Export feature on AWS

Method	Time
Internet (20Mbps)	45 days
FedEx	1 day

Time to transfer 10TB [AF10]

5. Performance unpredictability
  - Example: VMs sharing the same disk → I/O interference
  - Example: HPC tasks that require coordinated scheduling

Primitive	Mean perf.	Std dev
Memory bandwidth	1.3GB/s	0.05GB/s (4%)
Disk bandwidth	55MB/s	9MB/s (16%)

Performance of 75 EC2 instances in benchmarks

---

---

---

---

---

---

---

---

**10 obstacles and opportunities**

6. Scalable storage

- Cloud model (short-term usage, no up-front cost, infinite capacity on demand) does not fit persistent storage well

7. Bugs in large distributed systems

- Many errors cannot be reproduced in smaller configs

8. Scaling quickly

- Problem: Boot time; idle power
- Fine-grain accounting?

WiSe Lab @ WMU  
www.cs.wmich.edu/wise Cloud Computing 2017 63

---

---

---

---

---

---

---

---

**10 obstacles and opportunities**

9. Reputation fate sharing

- One customer's bad behavior can affect the reputation of others using the same cloud
- Example: Spam blacklisting, FBI raid after criminal activity

10. Software licensing

- What if licenses are for specific computers?
  - Example: Microsoft Windows
- How to scale number of licenses up/down?
  - Need pay-as-you-go model as well
